CVARS 6m Repeater

The CVARS just installed their 6m repeater on Mount Brenton: 52.870 MHz (FM) -1.7 MHz (51.170 MHz), T141.3 Hz. The antenna is a vertically polarized folded dipole, but I had a QSO on the repeater with my horizontal 204' G5RV and I could hear the it S9.

Jay VE7JVA is asking for signal reports so they can determine the coverage of the repeater:

> Even if you can only receive the repeater transmissions, or even just the Station ID (VE7AQW in morse code, there ya go a chance to practice up listening to CW!!!). Even then, your input will help us out. I am asking for:
>
> - Time and Date
> - Your location (Lat/Long would be a bonus)
> - Signal strength and quality
> - Any notable observations, such as dropouts, multipath reception, background noise, etc.
>
> Please email your reports to: jvinden@shaw.ca
